What is Visual Concert™?

Visual Concert from Polycom is a series of collaboration products designed to maximize the video communications experience for casual and power users alike.   This innovative approach to information sharing provides the highest resolution possible (SXGA)! For the first time ever, end users can select from a growing suite of tools to complement the ViewStation line of videoconferencing systems. Whether the need is to share digital information from a PC or Macintosh, hardcopy material or 3D objects, Visual Concert offers easy-to-use solutions.

Visual Concert™ PC

Visual Concert™ PC is a PCMCIA one-slot card that hot swaps right into your laptop. Just plug the RJ-9 connector into the ViewStation microphone, and you're ready to start displaying live data in your videoconference or locally to a conference room at high resolution. The best part about it is that it's easy to use - plug and display! Designed for standard ViewStation™ customers: ViewStation™, MP and DCP. Unlike a traditional scan converter, the image is captured in its native format and coded for 4 x FCIF (704 x 480 NTSC, 704x576 PAL) display at the far end or locally on NTSC monitors. Also available in a software only (IP) version.

Visual Concert™ FX

The only collaborative product on the market with the capability of transmitting high resolution SXGA (1280 x 1024) live graphics and high quality audio at speeds up to 15 fps, including a multi-point call! Just plug in your laptop, desktop or Macintosh to the Visual Concert FX and begin sending images from business applications, proprietary applications, the Internet, rendering applications or even a video clip, all at the touch of a button. While viewing up to four sites on four monitors, captivate the audience's attention with Dual Stream graphics on a high-resolution projection system. No matter the sharing application, enhance your ViewStation FX or VS4000 functionality with a Visual Concert FX.

Visual Concert™ DC

This custom integrated document camera has the ability to send images at SXGA (1280x1024) resolution, with full motion capture during a video call! Save images from the glass onto a PCMCIA card, annotate images with a virtual drawing pen, view transparent material using backlighting or send a high-resolution preview with the Snapshot button. Login remotely through a specially designed web browser and view material on the platform while in a video call, or not! Collaboration now expands beyond just sharing digital files. Share printed material, a procedure, an experiment or any three-dimensional object and enhance your video communication effectiveness!

NOTE: ViewStation SP and ViewStation products require minimum of Release 7.0 software.   ViewStation FX/VS 4000 requires minimum of Release 4.0
